

BIM - The Challenges and Opportunities for Rail

Simon Wray, Infrastructure Lead, The BIMstitute, UK

8 pillars of BIM

PAS 1192-2: 2013 - How (Capex)

PAS 1192-3: 2014 - How (Opex)

PAS 1192-4:2014 - Data Exchange

PAS 1192-5:2015 - Data Security

CIC BIM Protocol - Legal

Soft Landings - Handover

Digital Plan of Works - When

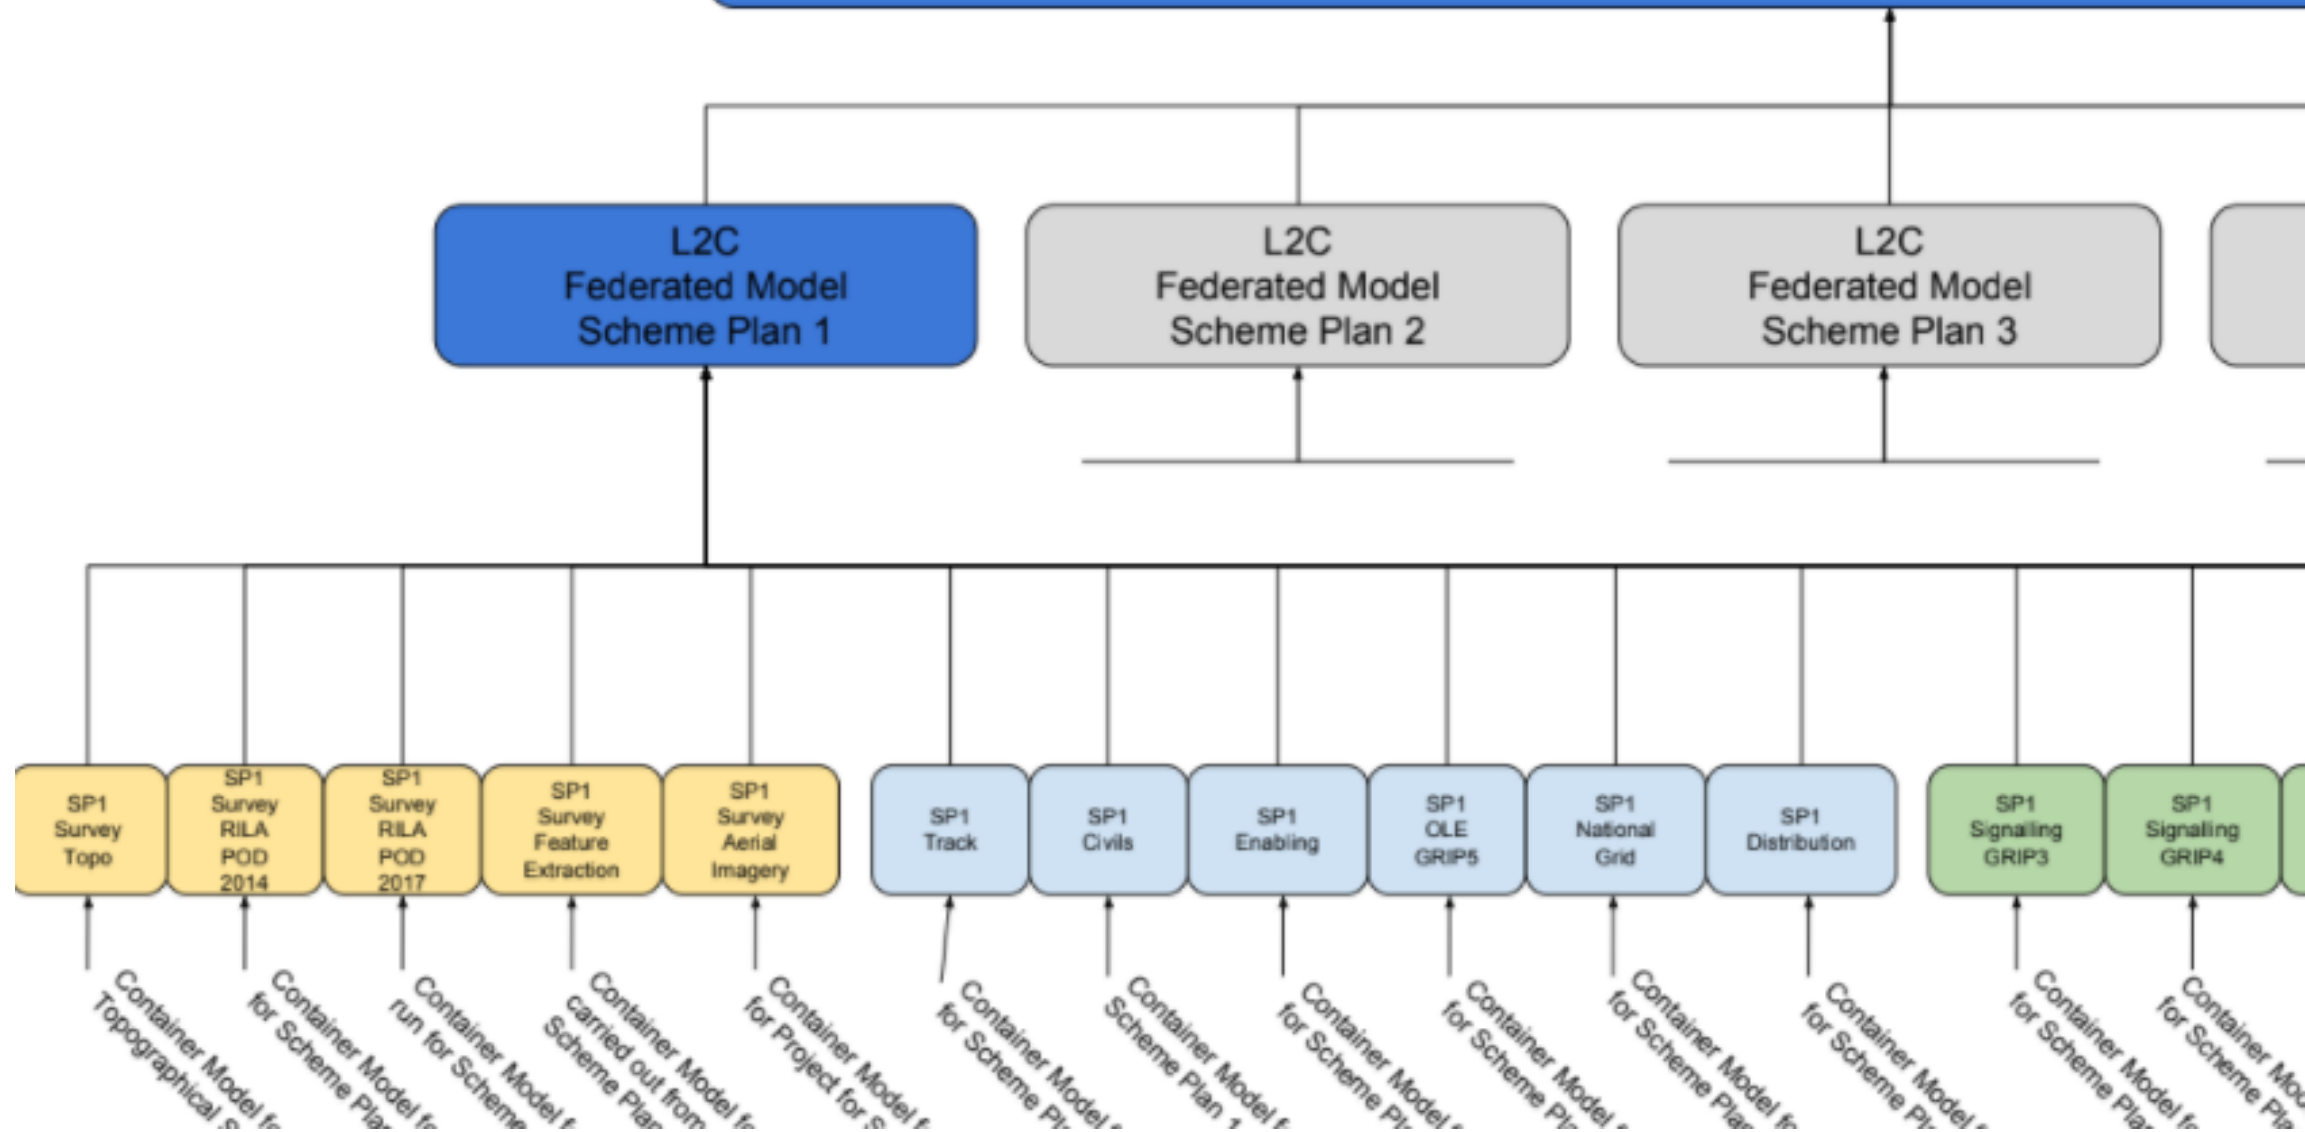

Classification - Naming

The background image shows a construction site for a railway. In the foreground, there are several parallel steel railway tracks laid on a bed of gravel. A worker in a high-visibility orange and yellow uniform and a white hard hat is visible on the left, looking down at some papers. In the center, a large, dark, rectangular metal beam is being hoisted by a crane. Other workers in similar uniforms are visible further back on the tracks. The sky is blue with some white clouds. The entire image is overlaid with a semi-transparent dark blue rectangle containing white text.

Fundamentally BIM is centred around three core elements:

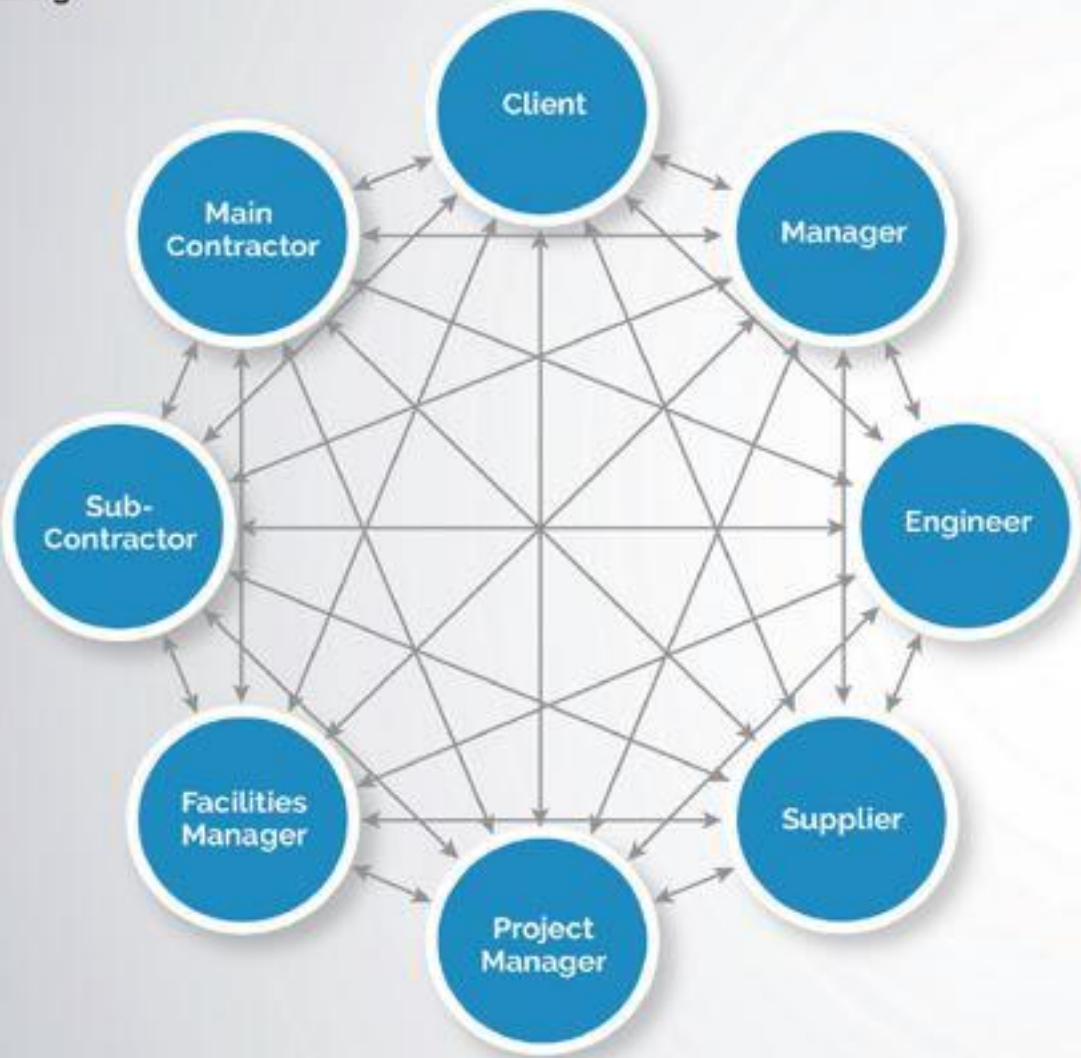

- Graphical Representation - An accurate digital 3-Dimensional representation of an asset
- Information (data and documents) - to support design, fabrication, construction, operations and maintenance
- Standardisation - Processes, standards and behaviours to work consistently and collaboratively

Key Challenges

- B in BIM stands for Building
- Classifications are all written for buildings - not infrastructure
- Lack of informed and impartial support
- Fragmented asset information requirements
- Lot's of “noise” - hundreds of vendors, who to choose,?
- Rail Design tools not BIM compliant....
