1. INTRODUCTION TO RAIL BALTICA

The Baltic countries Estonia, Latvia and Lithuania have historically been linked to the east-west railway transport axis using the 1520mm gauge railway system. Because of the existing historical and technical constraints, the existing rail system is incompatible with mainland European standards, thus there is a consensus that Estonia, Latvia and Lithuania need to be fully integrated into the wider European rail transport system. Currently there is no efficient 1435 mm railway connection along the Warsaw-Kaunas-Riga-Tallinn axis, i.e. there are missing links or significant bottlenecks. Thus, there are no direct passenger or freight services along the railway axis as the existing infrastructure does not allow for competitive services compared to alternative modes of transport. Thus, the clear majority of the North-South freight is being transported by road transport and the overall accessibility in the region is low.

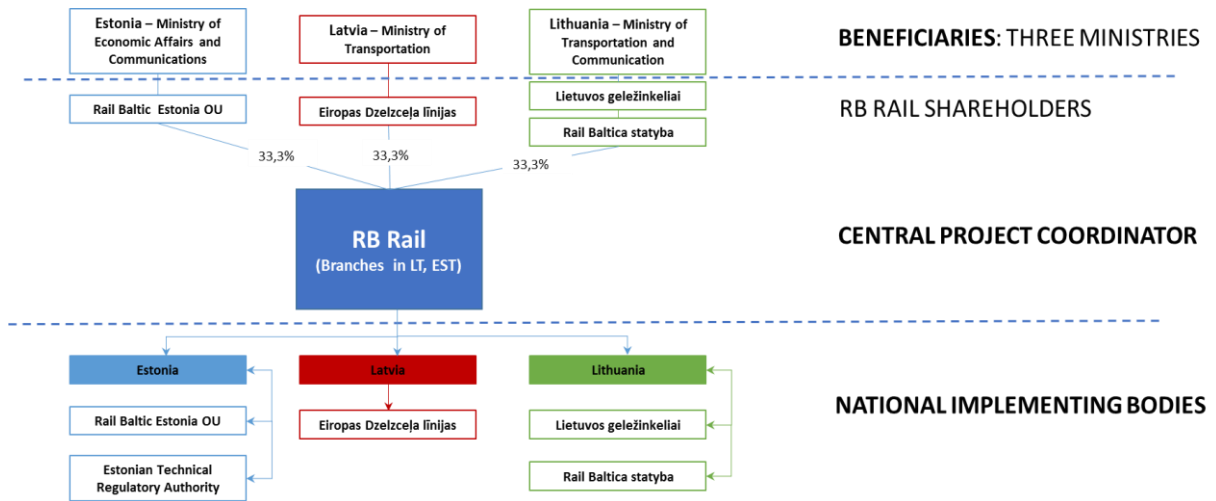

The ambitions of the Rail Baltica Global project (Global Project) are:

- to become a powerful catalyst for sustainable economic growth in the Baltic States;
- to set a new standard of passenger and freight mobility;
- to ensure a new economic corridor will emerge;
- sustainable employment and educational opportunities;
- an environmentally sustainable infrastructure;
- new opportunities for multimodal freight logistics development;
- new intermodal transport solutions for passengers;
- safety and performance improvements;
- a new value platform for digitalization and innovation;
- completion of Baltic integration in the European Union transport ecosystem.

Rail Baltica is already designed to become a part of the EU TEN-T North Sea – Baltic Core Network Corridor, which links Europe's largest ports of Rotterdam, Hamburg and Antwerp – through the Netherlands, Belgium, Germany and Poland – with the three Baltic States, further connecting to Finland via the Gulf of Finland short sea shipping connections with a future fixed link possibility between Tallinn and Helsinki. Further northbound extension of this corridor shall pave the way for future connectivity also with the emerging Arctic corridor, especially in light of the lucrative prospects of the alternative Northern Circle maritime route development between Europe and Asia. Furthermore, the North Sea – Baltic Corridor crosses with the Baltic-Adriatic Corridor in Warsaw, paving the way for new supply chain development between the Baltic and Adriatic seas, connecting the Baltics with the hitherto inadequately accessible Southern European markets. In a similar fashion, Rail Baltica shall strengthen the synergies between North-South and West-East freight flows, creating new trans-shipment and logistics development opportunities along the Europe and Asia overland trade routes. The new Rail Baltica infrastructure would, therefore, not only put the Baltics firmly on the European rail logistics map, but also create massive opportunities for value creation along this infrastructure with such secondary economic benefits as commercial property development, revitalization of dilapidated urban areas, private spin-off investment, new business formation, technology transfer and innovation, tourism development and other catalytic effects. Rail Baltica aims to promote these effects from the early stages of the Global Project, learning from the key global success stories and benchmarks in this regard.

The Contracting authority RB Rail AS (RBR) was established by the Republics of Estonia, Latvia and Lithuania, via state-owned holding companies, to coordinate the development and construction of the fast-conventional standard gauge railway line on the North Sea – Baltic TEN-T Core Network Corridor (Rail Baltica II) linking three Baltic states with Poland and the rest of the EU.

The diagram below illustrates the shareholder and project governance structure of the Rail Baltica project.

RBR together with governments of Estonia, Latvia and Lithuania (represented by the ministries in charge of transport policy) have applied for the CEF co-financing in 2015, 2016 and 2017 (three applications in total). The applications were successful and INEA grants are available to support the Global Project expenses.

Rail Baltica is a joint project of three EU Member States – Estonia, Latvia and Lithuania – and concerns the building of a fast conventional double-track 1435 mm gauge electrified and ERTMS equipped mixed use railway line on the route from Tallinn through Pärnu (EE), Riga (LV), Panevėžys (LT), Kaunas (LT) to the Lithuania/Poland state border (including a Kaunas – Vilnius spur) with a design speed of 240km/h. In the longer term, the railway line could potentially be extended to include a fixed link between Helsinki and Tallinn, as well as integrate the railway link to Warsaw and beyond.

The expected core outcome of the Rail Baltica Global Project is a European gauge (1435mm) double-track railway line of almost 900 km in length meant for both passenger and freight transport and the required additional infrastructure (to ensure full operability of the railway). It will be interoperable with the TEN-T Network in the rest of Europe and competitive in terms of quality with other modes of transport in the region. The indicative timeline and phasing of the project implementation can be found here: <http://www.railbaltica.org/about-rail-baltica/project-timeline/>.

2. PROCUREMENT OBJECTIVES

This chapter describes the aims and deliverables of Mineral Material Study (hereinafter - Study) which is focusing on assessing the suitability of locally produced aggregates in Lithuania according to the Rail Baltica Design Guidelines (RB DG) and UIC 719R requirements for constructing the **embankment, prepared subgrade** and **subballast** layers of Rail Baltica railway and providing technically and financially feasible solutions to expand the possibilities to use locally available soils and aggregates. Assessing the locally produced aggregates according to the Rail Baltica Design Guidelines' ballast requirements is not within the scope of this Study.

The study consists of:

- Fieldworks (sampling in Lithuania);
- Laboratory testing according to the test methods described in this document (see Table 1);
- Comparing and analyzing the results with the RB DG (Annex A) and UIC 719R requirements and Annex B frost susceptibility criteria;
- Describing laboratories' capabilities and capacities to do the tests described in this document in Lithuania;
- Solving engineering tasks described in this document (Work Packages 2 and 3);
- Preparing inception, interim and final reports presenting the findings and solutions/recommendations by the Consultant² for designing and constructing Rail Baltica railway line in Estonia, Latvia and Lithuania.

The deliverables of the Study are divided into three parts (**Work Packages**), which need to be carried out by the Consultant:

1. Work Package 1:

- 1.1. Assessment of locally produced aggregates' properties in Lithuania based on:
 - 1.1.1. „Rail Baltica Design Guidelines. Railway Substructure Part 1, Embankments and Earthworks“ (consolidated table with RB DG requirements are described in Annex A);
 - 1.1.2. UIC 719R „Earthworks and track bed for railway lines“ (3rd edition, February 2008);
 - 1.1.3. Three frost susceptibility criteria described in Annex B “Methods for assessing the frost susceptibility of soils”.
- 1.2. Detailed overview about the capabilities of local accredited laboratories which could conduct the tests according to the test methods described in this document.

2. Work Package 2:

- 2.1. Necessary prepared subgrade thickness calculations on embankments made out from QS0, QS1, QS2 and QS3 soils (soil quality classes and calculation methodology is described in UIC 719R);
- 2.2. Propose at least three cost-effective ways to stabilize “high plasticity soils with more than 15% of fines” (QS0 and QS1 soils according to UIC 719R).

3. Work Package 3:

- 3.1. Proposing technically valid and facts-based solutions to maximize the usage of locally produced aggregates for constructing Rail Baltica railway subbase and prepared subgrade layers, taking into account the test results from Work Package 1 and 2.

2.1. Work Package 1

First part of the Work Package 1 consists of assessing the properties of aggregates produced in Lithuania based on the requirements stated in the RB DG (see Annex A), UIC 719R and this document (see Table 1 and Annex B). For this purpose, sampling and testing must be carried out by the Consultant in Lithuania. Only active quarries in Lithuania with appropriate and valid Certificate of Factory Production

² Definitions “the Tenderer” and “the Consultant” are considered as equal in terms of their meaning.

Control (FPC) shall be included in the Study. The quarries must provide most recent Declaration of Performance (DoP) or Declaration of Conformity (DoC) for the material(s) which shall be included to this Study. The Study shall include suitable quarries within a range of 60 km from the Rail Baltica corridor in Lithuania. This range can be extended only if appropriate quarries don't exist within the aforementioned range.

NOTE: The aim of the Study is not to check the properties' compliance with the declared values expressed on the DoPs or DoCs. Therefore, the final report shall be prepared in a way which does not allow to link quarries with the results described in the report.

The Consultant shall:

1. Choose 5 **sand**, 5 **gravel** and 5 **dolomite/limestone quarries** in Lithuania with appropriate and valid certificate of FPC and producing aggregates according to EN 13242 and/or EN 13285 product specifications. The quarries/producers must provide DoP or DoC for every product which is included in the Study. When choosing the quarries, the Consultant must provide a list of at least 10 sand, 10 gravel and 10 dolomite/limestone quarries to the Contracting authority. The Consultant shall study, review and use as a reference report "Supply of Mineral Materials for Rail Baltica in Lithuania" (shall be made available to Consultant).

NOTE 1: The choice must be made assuming that the quarries produce aggregates with average and most widespread properties regarding the Lithuanian aggregate market. List with the selected and chosen quarries must be submitted to the Contracting authority for approval. The Contracting authority shall review the list and approve the list within one week.

For sand and gravel quarries or unbound limestone/dolomite mixtures, the declared maximum fines content must be f_{15} or lower according to EN 13242 (UF15 or lower according to EN 13285). For gravel quarries and unbound limestone/dolomite mixtures, the declared resistance to fragmentation must be either LA₃₀, LA₃₅ or LA₄₀ according to EN 13242.

NOTE 2: If the Tenderer or member of the partnership (if the Tenderer is a partnership) is related with aggregate production, then the Tenderer must inform Contracting authority about the existence of such partnership with proven evidence.

If the Tenderer is willing to take the samples from related partnership quarries, then the number of partnership related quarries shall not exceed 2 sand, 2 gravel and 2 dolomite/limestone quarries.

2. Organize sampling, transport and reduction of the samples according to EN 932-1 "Tests for general properties of aggregates - Part 1: Methods for sampling" from the quarries.

NOTE 1: The Consultant shall contact the quarries to get the permission for sampling and inform the quarries about the tests to be done. The Consultant shall inform the Contracting authority's representatives about the sampling schedule and providing information about the quarries (contacts, location, products, etc.) and sampling dates and times. The Consultant shall collect FPCs and DoPs or DoCs for each quarry and material included in the Study. The Consultant must be aware that the Contracting authority's representative may be present during the sampling and guide the Consultant choosing the stock for sampling.

NOTE 2: The Consultant shall make sure that the amount of each sample is sufficient to conduct all the necessary tests according to the prescribed test methods. The Consultant must take into account that test methods can set requirements for minimum quantity of the sample to conduct the test.

3. Organize the testing of the samples in accredited laboratory or laboratories (according to EN ISO/IEC 17025) according to necessary test methods as described in Table 1.

NOTE: The Consultant must provide accreditation certificate and accreditation scope for every laboratory which is going to be used by the Consultant.

4. Compare the test results with the RB DG requirements described in Annex A, UIC 719R and three frost susceptibility criteria described in Annex B.

Second part of the **Work Package 1** is to describe the market situation of laboratory services in Lithuania. For that purpose, the Consultant shall conduct a market survey, describing following:

2. List of accredited laboratories in Lithuania, including contact information, which provide aggregates testing services;
3. List of available test methods (including accredited and not accredited methods) for each laboratory described in previous point, including precision data (repeatability and reproducibility) if available;
4. For every laboratory described in point 1, a price estimation for upgrading the laboratory equipment in order to provide following accredited services:
 - a. Micro-Deval testing according to EN 1097-1;
 - b. Methylene blue testing according to EN 933-9;
 - c. Resistance to freezing and thawing according to EN 1367-1;
 - d. Maximum Standard and Modified Proctor density according to EN 13286-2 for upper aggregate size "D" up to 63 mm;
 - e. California Bearing Ratio (saturated) according to EN 13286-47;
 - f. Permeability according to CEN ISO/TS 17892-11;
 - g. Water suction height according to EVS-EN 1097-10.

2.2. Work Package 2

According to RB DG and UIC 719R, the embankment/excavated surface soils are categorized into four different soil quality classes (QS classes) as described in Table 2. These soil quality classes have an impact on the actions taken during the designing and construction phase. Based on the embankment soil quality class, a prepared subgrade layer (with QS3 soil quality class) shall be constructed on top of the embankment/excavated surface with a given thickness to achieve necessary bearing capacity class P3 for the railway. The aim of Work Package 2 is to calculate necessary prepared subgrade thicknesses for each of the embankment/excavated soil quality class and propose feasible technical solutions how to improve QS0 and QS1 soils with "high plasticity and fines content more than 15%".

Table 2. Soil Quality Classes according to RB DG and UIC 719R

Soil Quality Class according to RB DG and UIC 719R	Soil general description	Description
QS0	Unsuitable	These soils do not form a suitable subgrade and therefore require improvement (replacement to a certain depth with better quality soil, stabilization with binders, use of geotextiles, reinforcement with piles, etc.).
QS1	Poor	These soils are acceptable in their natural condition subject to adequate drainage being provided and maintained in good order. These soils could be considered for upgrading by means of an appropriate treatment (e.g. stabilization with binders).
QS2	Average	
QS3	Good	

The Consultant shall:

1. Calculate the thickness of prepared subgrade on embankments with soil quality class of QS1, QS2 and QS3, using the methodology described in the UIC 719R, considering following:
 - a. Subgrade bearing capacity class must be P3 (good subgrade);
 - b. Ballast layer thickness is 300 mm (fixed by RB DG);

- c. Subballast layer thickness is 320 mm (fixed by RB DG);
 - d. Frost penetration depth for Lithuania is 1,70 m. Embankment soil is a) frost susceptible and water level can't be lowered; b) non-frost susceptible.
2. Propose at least **three different feasible and cost-effective technical solutions** besides soil replacement to improve embankment soils QS0 and QS1 (high plasticity and fines content above 15%). Provide detailed Cost Benefit Analysis report for each solution, including Capital Expenditure (CAPEX) and Operational Expenditure (OPEX). Outline advantages and disadvantages for each of these options. The Consultant shall describe in detail the technical and financial optimization strategies of the proposed solutions.
 3. Provide draft cross-section designs for solutions described in previous points 1 and 2.

2.3. Work Package 3

Rail Baltica Design Guidelines set high requirements for the aggregates used for constructing subballast and prepared subgrade layers. This has a negative impact on the availability of locally produced aggregates suitable for constructing these layers. The aim of Work Package 3 is to describe facts-based and feasible technical solutions by the Consultant for constructing subballast and prepared subgrade layers with locally produced aggregates having less favorable mechanical and physical properties (e.g. gravel with rounded particles and higher fines content). The proposed solutions must expand possibilities to use locally produced aggregates for constructing subballast and prepared subgrade.

The Consultant shall:

1. Provide at least **six different feasible and cost-effective technical solutions** allowing locally produced aggregates to be used for constructing subballast and prepared subgrade layers, e.g.:
 - a. Increasing the thicknesses of upper structural layers to decrease the stresses to the layers below;
 - b. Chemical (bitumen, cement, lime, etc.) or mechanical (geosynthetics, gradation limits, etc.) stabilization;
 - c. Alternative materials for subbase, e.g. asphalt subbase (including detailed description on the impact on layer thickness);
2. Provide detailed Cost Benefit Analysis report for at least six most comprehensive solutions, including Capital Expenditure (CAPEX) and Operational Expenditure (OPEX). Outline advantages and disadvantages for each of these options. The Consultant shall describe in detail the technical and financial optimization strategies of the proposed solutions.
3. Propose the most feasible solution and suggested option to be used for Rail Baltica Railway project.

NOTE: For every proposed solution the technical details shall be described. The proposed solutions shall be reviewed by Contracting authority's experts. The Consultant shall prepare a presentation and introduce the results to the Contracting authority's experts after the Draft Final Report is submitted to the Contracting authority.

ANNEX B - METHODS FOR ASSESSING THE FROST SUSCEPTIBILITY OF SOILS

This chapter refers to three different methods that could be used for assessing the frost susceptibility of soils (Table B.1, B.2 and Figure B.1). All these methods are according to UIC 719R acceptable for assessing the soils' frost susceptibility.

Table B.1. Frost susceptibility criteria according to Rail Baltica Design Guidelines.

Frost susceptibility	Classification according to EN 14688-1 and -2
Not susceptible	Sand, gravel
Slightly susceptible	Silty sand, Silty gravel
Susceptible	Clay, clayey moraine
Very susceptible	Silt, clayey silt, silty clay, silty moraine

Table B.2. Casagrande's frost susceptibility criteria.

Coefficient of Uniformity C_u	Maximum fines content
5	10
15	3

NOTE: For other C_u values the maximum fines content can be interpolated

Figure B.1. Gradation limits for frost non-susceptible soils (according to "DETERMINATION OF FROST-SUSCEPTIBILITY OF SOILS", Slunga, E., Saarelainen, S., 1989)

- If the gradation lies completely within the region 1, the soil is always frost susceptible, in the region 1L, the frost-susceptibility of a soil is low;
- If the gradation falls completely inside the regions 2, 3 or 4, the soil is not susceptible to frost;
- If the lower part of the gradation permanently passes the boundary of the next region on the finer side (upper limit), the soil is frost susceptible.
